

Multi-Store Smart Food Ordering & Delivery System

Project Report

1. Introduction

The proposed system is a multi-store smart food ordering and delivery platform where multiple restaurants can operate under a single software. The system allows customers to browse menus, place orders, track deliveries, and make payments, while store owners manage products and orders from their own dashboards. A super admin controls the entire platform.

2. Objectives

- Build a multi-store food ordering system
- Provide separate dashboards for each store
- Create a customer-friendly ordering interface
- Implement real-time order management
- Support multiple payment methods
- Add delivery area and charge system
- Include AI-based recommendation system
- Provide marketing and notification tools
- Develop an all-in-one role-based application
- Ensure secure and scalable architecture

3. System Users

Super Admin: Manage stores, view revenue, control system

Store Owner: Add products, manage prices, accept orders

Customer: Browse stores, place orders, track delivery

Delivery Man: View assigned orders, update status

4. System Features

Multi-store system, Super admin panel, Store dashboard, Customer web app, Fast order system, Payment system, Delivery tracking, Reviews & ratings, AI recommendation, Marketing tools, Secure server

5. Development Phases

Phase 1: Core ordering system, multi-store, dashboards

Phase 2: Payment, delivery, notifications, reviews

Phase 3: AI, marketing tools, analytics, optimization

6. Technology Stack

Frontend: React / Next.js
Backend: Node.js / Laravel
Database: MySQL / PostgreSQL
Hosting: Cloud / VPS
Payment: bKash / Stripe / SSLCommerz

7. Conclusion

This system provides a scalable multi-store food ordering platform with AI features, delivery tracking, and marketing tools. The phased development ensures structured implementation and scalability.
